

PROOF OF FORMULA 4.224.1

$$\int_0^u \ln \sin x \, dx = L\left(\frac{\pi}{2} - u\right) - L\left(\frac{\pi}{2}\right)$$

The function L is defined by

$$L(u) = - \int_0^u \ln \cos t \, dt.$$

The change of variables $t = \pi/2 - x$ gives

$$\begin{aligned} \int_0^u \ln \sin x \, dx &= \int_{\pi/2-u}^{\pi/2} \ln \cos t \, dt \\ &= \int_0^{\pi/2} \ln \cos t \, dt - \int_0^{\pi/2-u} \ln \cos t \, dt. \end{aligned}$$

This gives the result.
